1 Introduction

This Technical Specification defines the design, supply, installation, testing and commissioning, functional, performance, documentation, training and maintenance requirements of vehicle detectors. This document applies to the following types of vehicle detectors:

- Loop Detectors
- Radar Vehicle Detectors, and
- Infrared Vehicle Detectors.

The scope of this Specification includes the following:

- design of the site-specific system
- supply and installation of the above indicated vehicle detectors together with necessary accessories
- supply and installation of the associated structures
- electrical switchboard and associated internal wiring compliant with MRTS228
- provision and connection of mains power compliant with MRTS210
- communications between vehicle detectors and field processor, and
- connection to the Transport and Main Roads telecommunications network as per MRTS232 and MRTS245.

This is a new Specification on vehicle detectors. Previous versions of this Specification dealt with inductive loop detectors. The general requirements were kept in the main body of the Specification. Other requirements relating to each particular type of detector are listed in the Appendices.

The requirements of traffic counter/classifier are not within the scope of this document and reference should be made to MRTS251 for specific requirements of traffic counter and classifier.

The vehicle detector system shall be connected to STREAMS via a field processor to transmit vehicle volume, occupancy, speed and headway data.

This Specification shall be read in conjunction with MRS204 Vehicle Detectors, MRTS01 Introduction to Technical Specifications, MRTS50 Specific Quality System Requirements, MRTS201 General Equipment Requirements and other Technical Specifications as appropriate.

This Specification forms part of the Transport and Main Roads Specifications Manual.

2 Definition of terms

The terms defined in MRTS201 General Equipment Requirements apply to this Specification. Additional terminology relevant to this Specification is defined in the following table.

3 Reference documents

The requirements of the referenced documents listed in Table 3A of MRTS201 General Equipment Requirements and Tables 3a and 3b below, apply to this Specification. Where there are inconsistencies between this Specification and the referenced MRTS (including those referenced in MRTS201), the requirements specified in this Specification shall take precedence.

4 Quality system requirements

The quality system requirements defined in MRTS201 General Equipment Requirements apply to this Specification.

4.1 Hold Points and Witness Points

General requirements for Hold Points and Witness Points are specified in Clause 5.2 of MRTS01 Introduction to Technical Specifications.

The Hold Points and Witness Points applicable to this Specification are summarised in Table 4.1. There are no Milestones defined in the document.

4.2 **Samples for evaluation and product type approval**

The Contractor shall make available for approval by the Principal/Superintendent a sample of either a complete vehicle detecting system, or materials intended for the construction of the device at least 14 days prior to planned commencement of fabrication.

4.3 **Plans for Site acceptance testing and certification**

The Contractor shall supply site acceptance test plans to the Superintendent for approval 28 days prior to the site acceptance start date. **Hold Point 1**

The site acceptance test for the installed equipment shall be included in a report to the Superintendent for approval prior to the date of practical completion.

All non-conformances identified during the site acceptance testing shall be rectified at no cost to the Principal.

4.3.1 **Product type approval**

Only those products that have been type approved by ITS & Electrical Technology unit of Transport and Main Roads can be installed in the network.

4.4 **Guarantee/warranty**

The Contractor shall guarantee the equipment system supplied for a period of 24 months after the date of practical completion handover. The component parts shall each have a warranty guarantee of at least two years from the date of handover and at least five years for any part that is battery powered.

4.5 **Documentation submitted prior to commencement of Works**

Prior to the commencement of works, the successful tender will provide to the department for approval and retention, three copies of:

- fabrication and assembly drawings that include all of the components installed
- manufacturer’s specifications (catalogue extracts) of all major components detailing ratings and performance characteristics of the same
- a schematic layout of components, building details and interconnection diagrams
Hold Point 2

5 Functional requirements

The vehicle detection system shall provide at least the following data:

- vehicle volume
- lane occupancy
- vehicle speed
- per direction average speed
- per lane average speed, and
- headway data.

Vehicle detectors also used for camera-detected offences.

The vehicle detection system shall be able to communicate real-time data to the Principal’s traffic management system (STREAMS) via a field processor and Principal’s telecommunication system as per the provisions in MRTS232 and MRTS245.

The vehicle detection system shall consist of an internal clock. Facilities shall be available for the date and time of the internal clock to be set via the field processor to synchronise with NTP. All data shall consist of time details.

Each vehicle detector system shall be able to automatically re-tune/reset at the power on or detection of abnormality and load the site-specific configurations. It is also necessary to have local and remote reset facilities. When the detector system automatically re-tune/reset, it must advise the field processor of the start and end of the automatic re-tuning process.

The vehicle detection system shall have facility to store data within the system in non-volatile memory up to five million vehicles. In case of loss of communication with the traffic management system, data during the period of communication lost shall be automatically uploaded to the traffic management system once communication is resumed. Type of the data to be uploaded shall be user-configurable. The data stored within the vehicle detection system shall be accessible through the Principal’s telecommunication network.

The vehicle detection system shall have Windows®-based graphic user interface (GUI) for viewing real-time data and stored data. GUI shall be able to operate on all versions of Windows current at the time of procurement of the vehicle detection system. Viewing options shall be user-configurable.
GUI shall be able to run in both the traffic management system and PHCS. GUI shall have facility to display traffic history pattern at least for the last 1.5 sec together with current traffic data. The firmware shall be upgradable through any communication port remotely using the Principal’s telecommunication network or local connection at the site.

The vehicle detection system shall be reliable (MTBF greater than 10 years at 95% confidence level), low maintenance (minimum maintenance period greater than one year) and operate in all environmental conditions specified in MRTS201.

The above functional requirements are common to all vehicle detectors, except for those used for camera-detected offences. Functional requirements pertaining to specific kinds of vehicle detectors are listed in the appendices.

6 Operational requirements

The operational requirements defined in MRTS201 General Equipment Requirements are applicable to this Specification. System-specific operational requirements are listed in the appendices.

7 Performance requirements

The vehicle detection data shall have the following accuracies/performance parameters when individual vehicle speeds are between 20 km/hr and 110 km/hr and traffic flow up to 2400 vehicles/hr/lane, excluding vehicle detectors used for camera-detected offences:

- vehicle speed – 5 km/hr
- per direction average speed – 95% averaged over 15 minutes
- per lane average speed – 95% averaged over 15 minutes
- vehicle volume – 98% averaged over 15 minutes
- lane occupancy – 98% averaged over 15 minutes
- headway data – 98%, and
- detection finalisation time < 80 ms.

The detection system and associated structure shall be able to operate in environmental conditions listed in MRTS201 and variation in operating conditions specified in AS 2703. The vehicle detection system shall be able to operate in rain up to 100 mm per hour. All system components shall have at least 20 years life span.

The detection system shall automatically start to operate within 10 seconds of power up or interruption of power.

The latency of the vehicle detection system shall meet the requirements of STREAMS.

Further performance requirements pertaining to specific types of vehicle detectors are listed in the appendices.

8 Mechanical and physical requirements

The mechanical and physical requirements defined in MRTS201 General Equipment Requirements apply to this Specification. All pavement-mounted hardware shall withstand vibration of repeated pavement impacts from up to 50,000 vehicles per day.
All power supply units and other additional hardware that are required to be installed in the field cabinet shall be mountable in 19-inch rack and meet the provisions of MRTS226.

Further mechanical and physical requirements pertaining to specific kinds of vehicle detectors are listed in the appendices.

9 Design requirements

Detail design drawings, design calculations, manufacturer Specifications and schematic layout of the components shall be forwarded to the Principal for review. All designs shall be certified by a suitably qualified RPEQ.

Vehicle Detectors associated with Camera-Detected Offences (CDO) shall have detail design drawings, design calculations, Specifications and schematic layout of the relevant components shall be forwarded to the Photographic Detection Device (PDD) Manufacturer for review and certification by an appropriately qualified RPEQ prior to installation.

10 Electrical requirements

The electrical requirements defined in MRTS201 and MRTS228 apply to this Specification. Main power shall be provided at each site in accordance with the provisions in MRTS210. All electrical work shall be in accordance with the Electrical Legislation, AS/NZS 3000 and AS/NZS 3100.

Additional electrical requirements under this Specification are as follows:

- Unless otherwise specified, power supply to the vehicle detector system shall be 230 VAC +/- 10%. Power converters shall be used to obtain other power requirements.
- The mains power supply input shall be fused and isolated. The output from the LV power supply shall be protected against short circuit conditions and provide overload protection. All fault conditions shall be cleared by an electrical protection device in less than 400 ms in compliance with AS/NZS 3000 and MRTS228, and
- A main power switch shall be located on the front faceplate and illuminated to indicate the availability of mains power and LEDs shall be located on the power supply front faceplate to indicate available regulated output voltages.

Further electrical requirements pertaining to specific kinds of vehicle detectors are listed in the appendices.

10.1 Lightning/surge protection

Lightning/surge protection shall be provided to all power supply and communication cables into the field cabinet and equipment in order to mitigate effect from voltage transient in accordance with provisions in AS 1768.

11 Telecommunication requirements

Each vehicle detection site, excluding vehicle detectors used for camera-detected offences, shall be provided with telecommunication port through the Principal’s telecommunication network in accordance with provisions in MRTS245. The telecommunications requirements defined in MRTS201 General Equipment Requirements apply to this Specification.

All radio communication and telecommunications equipment shall comply with relevant Australian Communications and Media Authority technical standards and requirements.
11.1 **STREAMS compatibility**

Each vehicle detection system shall communicate with STREAMS either through a field processor or direct Ethernet. If communication with STREAMS is through a field processor, the vehicle detection system shall consist of field processor device driver, enabling communication between the vehicle detection system and the field processor. To satisfy these requirements, the vehicle detection system shall possess STREAMS compatibility certification.

The vehicle detection system shall allow automatic operation and local manual operation independent of STREAMS. Initiation of local operation shall be through separate switch at the site or plug in of PHCS to one serial port. Vehicle detection data shall be communicated to STREAMS while system is in local manual operation.

11.2 **Communication**

The vehicle detection system shall consist of two communication ports.

Communication between the vehicle detection system and field processor either shall be direct serial using either EIA/RS 422 or 4-wire EIA/RS 232 through any port, or Ethernet using TCP/IP protocol. Serial protocol shall use recognised industry standards.

The communication requirements specified in MRTS201 General Equipment Requirements apply to this Specification. Further communication requirements pertaining to specific kinds of vehicle detectors are listed in the appendices.

12 **Electromagnetic compatibility**

All equipment shall be C-Tick tested and comply with EMI and EMC requirements of AS/NZS 61000.6.1 and 61000.6.3. System-specific requirements are specified in the appendices.

13 **Installation requirements**

Only Transport and Main Roads type approved vehicle detector systems shall be used. All vehicle detector systems, except vehicle detectors used for camera-detected offences, must have a current Transport and Main Roads type approval and hold a current STREAMS interface approval.

The installation requirements listed in MRTS201 General Equipment Requirements apply to this Specification.

To ensure proper operations of the detector after installation, verification of the detector site by a manufacturer’s representative after installation shall be carried out. **Hold Point 3**

Additional system-specific installation requirements are listed in the appendices.

14 **Testing and commissioning**

The testing and commissioning requirements as defined in MRTS201 General Equipment Requirements apply to this Specification.

Tests for checking detector operational performance shall be similar, as applicable, to the tests specified in Appendices A, B and C of AS 2703 for inductive loop detectors.
Specific tests, similar to those shown in AS 2703, are required to demonstrate that the detector system can meet the performance requirements. AS 2703 is the standard for loop detectors, but similar tests for other types of detection system are required.

Additional system-specific testing and commissioning requirements are listed in the appendices.

The operation of the vehicle detector shall be tested in accordance with the manufacture’s Specification. This may include the Principal testing the detector in their traffic management software, which in most cases will be STREAMS. The contractor shall allow the Principal five working days to verify the operation of the loops, after they have notified the Principal of successful testing, as well as provided copies of conforming test results.

15 Documentation

The documentation requirements defined in MRTS201 General Equipment Requirements apply to this Specification.

Additionally, if required, Form M4300 shall be submitted to the Principal within five working days of installation. The form shall be fully populated to the satisfaction of the Principal. Witness Point 1

Prior to practical completion, all documentation must be updated to reflect any variations from the original design.

All engineering design drawings shall be certified to meet the requirements of relevant Australian and international standards by a Registered Professional Engineer of Queensland who is practicing within the appropriate/relevant field of engineering.

All updated manufacturer equipment manuals, maintenance manuals, procedures, design documentation, engineering drawings and system specific software and hardware configurations shall be supplied to the Principal for acceptance. Hold Point 4

Additional system-specific documentation requirements are listed in the appendices.

16 Training

The training requirements defined in MRTS201 General Equipment Requirements apply to this Specification. Additional system specific training requirements are listed in the appendices.

17 Handover

The handing over requirements defined in MRTS201 General Equipment Requirements applies to this Specification. Additional system-specific requirements are listed in the appendices.

18 Maintenance

The maintenance requirements defined in MRTS201 General Equipment Requirements apply to this Specification. Additional system-specific maintenance requirements are listed in the appendices.
Appendix A: Loop detectors

The contents of this appendix had been extracted from the previous version of MRTS204 on Vehicle Loop Detectors.

1 General

Vehicle loop detectors use the change of inductance of a wire loop buried below the road pavement surface for the detection of vehicles passing or standing over the loop. The loop can be rectangular or quadruple as shown in Standard Drawing 1424.

Although rectangular loops are more popular now than quadruple loops, quadruple loops are still in use and this type of inductive loop is still specified in this specification.

The vehicle loop detector includes a detector loop buried below the road surface, field termination, feeder cable, loop termination panel/block and a detector module that includes a power supply, processing circuitry and associated cables.

New notes on red light camera installations.

Details on the configuration and placement of vehicle detector loops used in red light camera installation are shown in Standard Drawings 1425, 1701, 1703 and 1704.

The requirements listed in this Appendix are additional requirements specific to this particular type of technology and are to be read in conjunction with the requirements listed in the main document.

2 Equipment components

Each vehicle loop detector installation shall include:

- detector loops
- detector loop field termination
- loop feeder cables
- loop feeder cable terminal panel/block
- cable connecting the loop feeder terminal panel and the detector module
- independent vehicle detector module
- connection between detector module and field processor
- field processor (not for vehicle detectors used for camera-detected offences)
- connection to Principal’s telecommunications network in accordance with the provision of MRTS245 and necessary hardware
- interface to STREAMS
- telecommunication field cabinet that complies with MRTS226, and
- provision of power supply that complies with MRTS210.
3 Operational requirements

The performance of the loop detector system is based upon vehicles entering the detection zone at speeds of between 8 to 120 km/h and a detection zone length of between 1 m and 4.5 m as per AS 2703.

3.1 Operating modes

Each detector shall be able to operate in passage or presence mode. The detector shall generally be configured to operate in presence mode. However, where installed as a permanent counting site it shall be configured to operate in passage mode.

Speed measurement in loop detectors shall be implemented using dual loops installed in accordance with the department's Traffic and Road Use Manual Interim Part 5.5 Guidelines for the Configuration and Placement of Vehicle Detector Sensors:

- Standard Drawing 1424 – Traffic Signals – Detector loop installation details in asphalt and/or
- Standard Drawing 1425 – Detector loop placement details
- Standard Drawing 1701 – Traffic signals - Detector loops counting/right turn loops and diode connection
- Standard Drawing 1703 – Traffic signals – Red light camera cable and loop details, and/or

3.2 Length of Detector Feeder Cable

The detector module shall be capable of operating with detector feeder cable up to 250 m.

3.3 Inductance range and frequency

The detector module shall automatically adjust to operate in accordance with the requirement of this specification when input impedance of the loop is between 50 μH and 700 μH, 70 μH for camera-detected offences and ‘Q’ factor in the range of:

- 5 to 50 below 60 kHz, and
- 3 to 50 above 60 kHz.

For vehicle classification or identification the ‘Q’ factor for a loop shall be in the range from 15 to 50.

The original record shall be provided to the Principal and a copy shall be placed in the cabinet housing the vehicle detector. Any vehicle detector which does not operate as per manufacture’s Specification shall be highlighted and specifically brought to the Principal’s attention. Witness Point 2

Under the above conditions, the operating frequency of the sensor shall be in the range of 20 kHz to 150 kHz. Facility shall be available to select the operating frequencies of the detector either on the printed circuit board or via an operator terminal.

3.4 Actuation range

The vehicle detector module shall respond to change of inductance between 0.02% and 10% of the initial inductance and the resultant output shall be maintained until the inductance level returns to the initial value.
3.5 Sensitivity settings

Facility shall be available to select sensitivity adjustment of each channel individually, preferably on the front panel of the detector card. The sensor unit shall be capable, as a minimum, of sensitivity adjustments in the following steps 0.02%, 0.05%, 0.1%, 0.2% and 0.5%. The tolerance on the threshold for each sensitivity setting shall be +0%, -10% in accordance with the requirements of AS 2703.

3.6 Turn-off time

The turn-off time following an actuation shall be within +/- 25 m/sec of the measured response time for the same actuation.

3.7 Presence time

The output of presence detector shall comply with the requirements of AS 2703.

3.8 Automatic drift compensation (tracking)

The detector sensor shall automatically compensate for variation of operating conditions as per the requirements of AS 2703.

3.9 Recovery from positive inductance change

In the event of sensor unit experiences positive inductance change, the sensor unit shall automatically re-tune.

3.10 Susceptibility to interference

The detection system shall comply with the requirements of AS 2703.

3.11 Crosstalk

The detector sensor shall employ sequential channel sampling or a similar technique to eliminate crosstalk between channels and shall comply with the requirements of AS 2703.

3.12 Leakage to earth

Susceptibility to earth leakage as specified in AS 2703 is applicable to this specification.

4 Mechanical and physical requirements

The detection system components shall be of modular construction to permit minimisation of redundant capacity when installed. Each detector installation shall allow expansion to a minimum of 24 detector loop inputs. The detector equipment shall be supplied in a basic configuration and shall be expandable by installation of additional modules if/when required.

4.1 Detector card dimensions

The detector electronics/cards shall comply with the requirements of either ANSI/NEMA TS1 Part 7 or Standard Eurocard Format. Rack-mounted cards shall utilise industry standard connectors.

4.2 Indicators

Each channel of the vehicle loop detector electronics/cards shall have at least one associated LED located on the front faceplate of the detector card. The LEDs shall be illuminated for the duration of each output signal, or if the loop terminals are short-circuited or open-circuited.

Indicators shall meet the requirements of AS 2703.
4.3 **Switches and adjustment facilities**

Switches and adjustment facilities shall meet the requirements of AS 2703. The manual re-tune facility shall be externally accessible for each detector channel. Each detector card shall have a reset push-button accessed from the front faceplate.

4.4 **Connection facility**

The requirements of AS 2703 on the connection facilities for independent sensor units are applicable to this specification.

5 **Electrical requirements**

The voltage impressed on the feeder cables by the sensor unit shall not exceed ELV under any condition of operation. Electrical isolation shall be provided between the supply mains and the loop terminals by means of a transformer complying with the requirements of AS/NZS 61558.

Neither the detector loop nor the sensor unit shall suffer damage if any of the connecting cables (other than power supply cables) are short-circuited, open-circuited or disconnected while the equipment is energised.

6 **Installation requirements**

Only the department’s type approved vehicle detector systems shall be used. All vehicle detector systems must have a current departmental type approval and hold a current STREAMS interface approval.

The installation of vehicle loop detectors shall be in accordance with MRTS93 in addition to the requirements outlined in this specification.

Reference to MRTS257 for the requirements on the installation of loop cable and feeder cable.

The installation of detector feeder cable and detector loop cable shall be in accordance with MRTS257, the Guidelines for the Configuration and Placement of Vehicle Detection Sensors, and in accordance with the following Standard Drawings:

Inclusion of additional Standard Drawings 1426, 1700, 1701 and 1702.

- SD1424 Traffic Signals – Detector loops formed in-situ in asphalt, installation details
- SD1425 Traffic Signals – Detector loops placement details
- SD1700 Traffic Signals – Detector loops vehicle identification (VID) placement details
- SD1701 Traffic Signals – Detector loops counting/right turn loops and diode connection details
- SD1702 Traffic Signals – Detector loops motorways and ramp placement, and installation details.

6.1 **Commencement of Works**

At least one full working day prior to intending to install the vehicle detector loops, the Contractor shall notify the Principal of the proposed work. The method of notification is as determined by the Principal.
The Contractor shall not proceed with the works until the Principal has issued acceptance of the proposed works. Hold Point 5

6.2 Loop configuration and loop spacing

Loop configuration and loop spacing shall be verified during installation against Transport and Main Roads Standard Drawings for the dimensioned layout that shows the spacing and lane separation. Hold Point 6

6.3 Loop feeder terminal panel

The detector loops shall be connected to the loop feeder terminal panel via loop feeder cables complying with the requirements of AS/NZS 2276.2. The loop feeder terminal panel shall provide terminal strips for all detector loops.

Cable looms are to connect the loop feeder terminals to the detector module. The cable looms shall provide a minimum of 24 vehicle detector inputs. Each set of adjacent terminals is denoted a designated pair. The conductors of each pair shall be twisted together at approximately eight turns/metre over the entire length of the loom.

All cables within the harness or loom leading from the loop feeder terminal panel or terminal strip to the detector module shall incorporate screening and/or noise suppression. The loom connecting the loop feeder terminal panel shall have a length of one metre.

The drain conductors for all detector feeder cables shall be connected to earth in the detector cabinet. Loop feeder cables shall be installed so as to minimise likelihood of crosstalk between channels.

7 Communication

Where specified, the vehicle detector system shall provide solid state digital outputs to the field processor through a 50-way ribbon cable connector in accordance with MRTS201. The 50-way ribbon cable shall be supplied with the detector system.

8 Testing and Commissioning

8.1 General

The loop detector system shall have type approval from the department or certification for the tests listed in Appendix B4 of AS 2703. The tests shall be carried out at a NATA-approved facility and test results shall be forwarded to the Principal prior to commencement of the project.

All loops shall be tested during installation, before the saw cut is sealed or the overlay placed on pre-fabricated loops. Each circuit shall be tested again when the loop feeder twin is connected to the loop lead-in cable before the connection is sealed.

Insulation resistance of the feeder cable and the loop cable shall be measured. Two other characteristics of the loop circuit to be measured are the inductance and resistance.

The testing of the loops is the same for both quadrupole and rectangular loop. The major determining factors on the inductance value of a loop are the configurations and the dimensions of the loop. All measurements are to be recorded on the appropriate form M4300.

Insulation resistance of the feeder cable and the loop cable will be measured once. Resistance and inductance of the loop circuit shall be measured at several stages during the installation. These measurements shall be recorded for each individual loop.
Where two or more loops are connected to the one vehicle detector sensor channel, the inductance and the resistance of the loop and feeder cable circuit is to be measured as a total.

All works shall meet the requirements of the Wiring Rules, MRTS228 and the local electricity supply authority.

8.2 Testing equipment requirements

All measurements shall be undertaken using a device with the following performance characteristics:

- measurement tolerance of ± 3%
- measurement range of 40 to 700 μH
- inductance measurement at loop tuned frequency
- self-tuning in the range of 40 to 800 μH
- input loop reading resonance between 15 kHz and 140 kHz
- a Q of ≥ 3 at typical resonant frequency for loops of the specified inductance range
- loop insulation integrity verification > 100 MΩ and within ± 10% accuracy, and
- DC resistance range 0.3 Ω to 9 Ω.

The Contractor shall nominate the device to be used and provide a copy of its current calibration certificate to the Principal before testing commences. Witness Point 3

8.3 Testing of feeder cable

The feeder cable shall be tested after installation and before being connected to the loop and the detector.

The drain conductors for all detector feeder cables are to be connected to earth in the detector sensor cabinet.

Earth continuity for the drain conductor shall not exceed 1.4 Ω/100 m. Core insulation resistance between the two cores and between earth and either core shall exceed 1 MΩ. Cables that fail any of these tests shall be removed and new cables installed.

8.4 Testing of individual loop

For loops fabricated on-site, all loop measurements are taken when the loop cable has been laid in the saw cut and the retaining wedges are in place to ensure the loop cable does not move in the saw cut. If possible the lead-in cable, from the loop, shall be placed in its saw cut. Any lead-in cable not placed in a saw cut shall be twisted to have a minimum of one full turn every 10 cm (10 turns per meter) before any measurements are taken.

For loops pre-fabricated, all measurements are taken when the loop cable has been laid in place and secured to ensure the loop cable does not move. The lead in cable from the loop should be twisted to have a minimum of one full turn every 10 cm before any measurements are taken.

The loop internal resistance and inductance shall then be measured.

Record the measurements for all loops on form M4300 and any measurements which are not within the requirements of Section 4 on operational requirements shall be highlighted and specifically brought to the Principal’s attention before the close of business on the next working day.

Witness Point 4
8.5 Testing of loop cable and feeder cable circuit

The inductance and resistance shall be measured again after the loop is connected to the loop feeder cable and before the connection joint is sealed. The results of these measurements should be the sum of the previous measurement for the loop and the increased resistance and inductance of the loop feeder cable. Any measurements which are not within 15% of the values calculated using Table A-8 shall be highlighted and specifically brought to the Principal’s attention before the close of business on the next working day. The final measurements for all loop circuits shall be recorded on form M4300 and submitted to the Principal within five working days of installation. \textbf{Witness Point 5}

Where two or more loops are connected to the one vehicle detector sensor channel, the inductance and the resistance of the combined loops and the feeder cable circuit is to be measured as a total.

For loops connected in series the formulae for calculations are:

\[ R_t = R_1 + R_2 \]  \quad \text{Resistance in Ohms (Ω)}
\[ L_t = L_1 + L_2 \]  \quad \text{Inductance in micro Henry (µH)}

For loops connected in parallel the formulae are:

\[ R_t = (R_1 \times R_2)/(R_1 + R_2) \]  \quad \text{Resistance in Ohms (Ω)}
\[ L_t = (L_1 \times L_2)/(L_1 + L_2) \]  \quad \text{Inductance in micro Henry (µH)}

8.6 Testing during installation

Insulation resistance, inductance and resistance of the loops shall be measured prior to installation and before the saw cut is sealed or the overlay placed on pre-fabricated loops.

The feeder cable shall be tested after installation and before being connected to the loop and the detector. Resistance of the conductors shall not exceed 1.4 Ω/100 m. Core insulation resistance between the two cores and between earth and either core shall exceed 1 MΩ. Cables that fail any of these tests shall be removed and new cables installed.

Each circuit shall be tested again when the loop feeder is connected to the loop lead-in cable before the connection is sealed. These measurements shall be recorded for each loop. The original record shall be provided to the Principal and a copy shall be placed in the cabinet housing the vehicle detector.

Where two or more loops are connected to the one vehicle detector sensor channel, the inductance and the resistance of the loop and feeder cable circuit is to be measured as a total.

Any measurements which are not within the guidelines set out in the Table A-8 below shall be highlighted and specifically brought to the Principal’s attention before the close of business on the next working day.

After connection of the loop circuit to the vehicle detector, the operation of the vehicle detector shall be tested in accordance with the manufacturer’s specification, including testing of the system using the Principal’s Traffic Management system.

Superseded
Appendix B: Infrared Vehicle Detectors

This is a new Appendix on the requirements of infrared vehicle detectors.

1  General

Infrared vehicle detectors (IRVD) use the events of break-and-make of infrared beams between transmitter and receiver mounted across the road, in perpendicular to traffic flow, for the detection of vehicle passing, and the calculation of vehicle parameters. Break-and-make events of the infrared beams occur when the infrared beams are blocked by the wheels of the vehicles. In most applications, multiple beams are used for obtaining vehicle parameters.

The requirements listed in this Appendix are additional requirements specific to this particular type of technology and are to be read in conjunction with the requirements listed in the main sections of the document.

2  Equipment components

Each infrared vehicle detector installation shall include:

- infrared transmitter
- infrared receiver
- provision of power supply that complies with MRTS210 General Equipment Requirements
- TCP/IP connection between infrared receiver and field processor/network switch using CAT 5 cable or alternative 3G wireless connection
- field processor, and
- connection to the Principal’s telecommunications network in accordance with the provision of MRTS245 and necessary hardware.

3  Functional requirements

In addition to the functional requirements listed in Section 5, the following specific requirements are applicable to IRVD systems:

- remote monitoring of infrared transmitter power, receiver power, beam degradation alarm or lens block alarm
- remote monitoring of battery parameters, such as voltage level and remaining battery capacity if batteries are used as power source
- method of verifying alignment (height, roll, pitch and yaw) for installation in existing roads without road closure and additional tools to assist installation in new constructions, and
- remote monitoring of alignment details, including tilt, pitch, yaw and height of the beam with respect to ground or correction of the alignment through the Principal’s telecommunication network.

4  Operational requirements

The following additional operational requirements are applicable to infrared vehicle detectors.
5  

Power

The infrared beam shall have sufficient power to avoid system performance degradation due to soiling or other environmental effects which lead to frequent maintenance. The maintenance interval shall be more than one year. The power level of the IR beam shall not cause any safety or health hazards.

5.1  Modulation

The beams shall be suitably modulated to avoid environmental effects.

5.2  Misalignment

The transmitter and receiver shall be able to operate with minimum of 10 degree misalignment.

5.3  Transmitter power and receiver sensitivity adjustment

The transmitter power and receiver sensitivity shall be able to adjust in order to meet requirements at the site. The adjustment of power and receiver sensitivity shall be either automatic or manual.

6  Mechanical and physical requirements

Infrared transmitter and receiver mounting arrangement shall consist of independent adjustment in all three axis for alignment together with locking arrangement to avoid change of alignment due to vibration and other environmental effects.

Printed circuit boards in the system shall be coated with protective layer to protect against moisture and water ingress. Transmitter and receiver shall be rated for IP 68 in accordance with AS/NZS 60529.

7  Electrical requirements

Power supply to the transmitter and receiver shall be ELV. Whenever mains power is used as power source, power converter equipment shall be installed in a separate cabinet.

8  Electromagnetic compatibility/safety approval

IRVD shall be EMI rated for AS/NZS 55022 Class B and safety approval shall be compliant to AS/NZS 60950.

9  Installation requirements

Only departmental type approved vehicle detector systems shall be used. All vehicle detector systems must have a current departmental type approval and hold a current STREAMS interface approval.

Installation of IRVD system shall meet the following requirements:

- transmitter and receiver shall be perpendicular to the traffic direction
- transmitter and receiver shall be aligned (height, roll, pitch and yaw)
- external housing shall be flushed with curb to avoid build-up of litter
- concrete apron to road edge shall be installed if required
- IR beam shall clear crown of the road at least by 50 mm, and
- vehicle bodies shall not obstruct the IR beam in near lanes.

The IRVD shall be configured to the road geometry.
10 Testing and commissioning

IRVD installations shall confirm the following aspects of alignment using software or hard tool:

- height
- roll
- pitch, and
- yaw.

Details of beam power level at the receiver shall be tested using software or other tool and shall meet the requirements of the manufacturer.

The testing of the IRVD system shall be in accordance with the manufacturer's recommendations.

**Hold Point 7**

Before the handover of the system the contractor shall notify the Principal in writing of the successful testing and provide copies of conforming test results and then allow the Principal five working days to verify the operation of the IRVD system. **Witness Point 6**
Appendix C: Radar Vehicle Detectors

This is a new appendix on the requirements of radar vehicle detectors.

1  General

Radar vehicle detectors (RVD) use reflection of transmitted electromagnetic radar signal, from the vehicles, for the detection of vehicle passing and calculation of vehicle parameters. The radar signal transmitter is mounted on the roadside perpendicular to the traffic flow. In most applications, multiple radar signal beams are used for obtaining vehicle parameters.

The requirements listed in this appendix are additional requirements specific to this particular type of technology and are to be read in conjunction with the requirements listed in the main sections of the document.

2  Equipment components

Each radar vehicle detector installation shall include:

- radar transmitter and receiver
- provision of power supply complying with MRTS210 General Equipment Requirements
- RS 232, RS 285 or TCP/IP connection between radar unit and field processor/network switch using standard cables or CAT 5 cable as applicable, and
- connection to the Principal’s telecommunications network in accordance with the provision of MRTS245 and necessary hardware.

3  Functional requirements

In addition to the functional requirements listed in Section 5, the following specific requirements are applicable to RVD systems:

- RVD system configuration shall be automatic or manual
- automatic configuration shall include defining of lanes within the detection area using probability density function of the detected vehicles
- manual configuration minimum increment level shall be less than 0.25 m
- remote monitoring of transmitted power and average receiver signal strength, and
- remote monitoring of input voltage.

4  Operational requirements

The following additional operational requirements are applicable to radar vehicle detectors.

4.1  Frequency

Radar signal frequency shall be ISM unlicensed band or other frequency band with appropriate license.

4.2  Side lobes

Side lobes power level shall be less than – 40 dB to avoid interference with other equipment.
4.3 **Bandwidth**
Bandwidth of the radar signal shall be greater than 240 MHz in order to achieve un-windowed radar resolution of at least 0.75 m.

4.4 **Transmitter power and receiver sensitivity adjustment**
Transmitter power and receiver sensitivity shall be able to adjust in order to meet requirements of various locations. The adjustment of power and receiver sensitivity shall be either automatic or manual.

4.5 **Beamwidth stability**
Beamwidth stability of the transmitted radar signal shall be more than 1%.

4.6 **Frequency channels**
Number of frequency channels should facilitate installation of multiple units in the vicinity without interference and minimum of four channels is preferable.

5 **Mechanical and physical requirements**
The radar unit shall be mounted directly to the mounting assembly fastened to a pole or other structure and have facility of movement in all three axis for alignment.

The printed circuit boards in the system shall be coated with protective layer to protect against moisture and water. Radar unit shall be rated for IP 68 in accordance with AS/NZS 60529. Radar unit housing shall be resistive to UV, fungus and corrosion.

6 **Performance requirements**
The following additional performance requirements are applicable to RVD:

- minimum detection range less than 2 m
- maximum detection range greater than 80 m
- number of detection lanes greater than 10
- any variation of lane width
- detection over barrier whenever more than 50% of the vehicle is visible to the radar, and
- minimum separation between vehicles shall be less than 1.7 m.

7 **Electrical requirements**

| Only departmental type approved vehicle detector systems shall be used. All vehicle detector systems must have a current departmental type approval and hold a current STREAMS interface approval. |
| Vehicle detectors used for camera-detected offences, do not require STREAMS interface approval. |

If power supply to the radar unit is ELV, the power converter equipment shall be installed in a separate cabinet.
8 Installation requirements

Site-specific installation plan shall be approved by the system manufacturer or system designer approved by the manufacturer. The site-specific installation plan shall contain installation details of the radar vehicle detector.

9 Testing of Radar Vehicle Detector

The testing of the RVD system shall be in accordance with the manufacturer’s recommendations. Hold Point 8

Before the handover of the system the contractor shall notify the Principal in writing of the successful testing and provide copies of conforming test results and then allow the Principal five working days to verify the operation of the RVD system. Witness Point 7
